Portable Isolated
Environment

Abstract: This project offers a portable device together with a webapp to facilitate the process of creating and carrying out evaluations. Ensuring a secure method in which students can use the peripherals of their personal computers in an isolated environment.

System Overview

Final Product

Result 1: The final product is a Raspberry Pi Zero W configured in gadget mode, acting as an active element that provides a custom Debian image built with live-build.

Result 2: On the professor's side, a webapp enables full exam management. During the exam flow, the professor can access specific student logs and monitor their activity in real time.

Conclusions: This project presents a secure and practical alternative to current digital exam environments, overcoming key limitations of existing solutions like SEB. By leveraging a Raspberry Pi-based system with a tailored OS and integrated platform, it ensures both security and usability. The solution empowers educators with control and reliability while offering students a streamlined exam experience
